## Executive Summary

At its November 2017 meeting, the Milwaukee Board of School Directors adopted Resolution 1718R-007 by Director Bonds Regarding a District-Wide Assessment of Substitute Teachers. The Board directed the Office of Accountability and Efficiency to examine trends, utilization, and practices.

This analysis sought to satisfy the resolution in its details and its intent. Specifically, the analysis reviewed practices, available absence and substitute teacher data as they relate to absenteeism and substitute fill rates, and a review of scholarly work on the topic.

Findings from the analysis revealed trends that show increasing teacher absenteeism and an associated increase in the hours paid to substitute teachers. There is also evidence of decreasing fill rates over the same period. A key factor in the need and use of substitute teachers is the fact that absences coded as teacher position vacancies make up nearly $40 \%$ of the transactions for substitute teachers. While the District makes use of a substitute employee management system (SEMS), a best practice, the match rates between the recorded teacher absences and those that appear in the SEMS are 60\%.

However, the data bears out what is suggested in the literature. The largest determinant of an absence being filled by a substitute teacher may be the lead time with which the opportunity to substitute is communicated to substitutes in the available pool. The association to lead time is so strong that even Friday absences are filled at rates above $80 \%$ with 3 days of lead time and a rate of nearly $90 \%$ with 4 days of notice.

While many alternatives are being explored to improve teacher absence fill rates, the strength of this association and its implications for potential solutions should not be overlooked.

## Introduction

If we define absence as "the lack of physical presence at a behavior setting when and where one is expected to be" (Harrison \& Price, 2003) we can begin to examine the fundamental basis for the use of substitute teachers, namely, a teacher absence. Regular teachers typically take an absence approximately ten times per school year, which is higher than comparable professionals who take only three sick days during an equivalent period (Roza, 2007). There has been some research that suggests a number of the absences taken by teachers are discretionary in nature (Ehrenberg, Ehrenberg, Rees, \& Ehrenberg, 1991).

Unfortunately, definitive causal relationships that explain teacher absences are sparse in the literature. According to Shapira-Lishchinsky (2009):

While absenteeism has received considerable attention in private sector organizations, teacher absence has been studied relatively little. The dearth of research on its causes is unfortunate because of the possible effects of teacher absence (Shapira-Lishchinsky \& Rosenblatt, 2009).

Causality notwithstanding, teacher characteristics correlated with absences and their potential to be predictive measures of absences have been studied and include prior absenteeism, age, education, and supervisory position (Rosenblatt \& Shirom, 2005). Absenteeism of individual teachers can even be associated with the attendance of that teacher's peers (Bradley, Green, \& Leeves, 2007). Further, the quality of the geographical location of a school is strongly associated with teacher absenteeism and the requisite need for substitute teachers (Bruno, 2002). Several studies also suggest the role of stress, burnout, and depressive symptoms in teacher absenteeism cannot be overlooked (Beer \& Beer, 1992; Mearns \& Cain, 2003; Steinhardt, Smith Jaggars, Faulk, \& Gloria, 2011).

Policy and institutional factors have also been shown to be associated with teacher absences whether they be allowances under the Family and Medical Leave Act (Wyld, 1995), opportunities for professional development and training (Calkins, 1989), or simply the availability of a bank of sick-leave and personaltime from which to draw while absent (Platt, 1987). Higher usage of sick leave has been associated with the presence of large banks of sick leave and a high annual allotment of sick time (Ehrenberg, Ehrenberg, Rees, \& Ehrenberg, 1991).

However, work to categorize absences in the workplace yields an approach that helps to break the problem into more manageable and quantifiable dimensions. One can examine teacher absences as those that are under the teacher's control (voluntary) and those that are not under the teacher's control (involuntary) (Chadwick-Jones, Brown, Nicholson, \& Sheppard, 1971; Steel, 2003).

While definitive causality of teacher absences is less known, the body of work on the impact of teacher absences is more developed. The effects range from reductions in student motivation and possible increased student absenteeism (Ehrenberg, Ehrenberg, Rees, \& Ehrenberg, 1991; Imants \& Zoelen, 1995), to lower student achievement via interruptions in students' instruction (Woods \& Montagno, 1997). Lastly, absences contribute to additional direct (Dalton \& Mesch, 1991) and indirect costs (Dansereau, Alutto, \& Markham, 1978) to an organization.

Having reviewed the substitute teacher equation from the demand-side of teacher absences, we examine the factors associated with substitute teacher labor supply. It is helpful to decompose the supply side into two parts: the total availability of substitute teachers, and the decisions of substitute teachers to accept opportunities.

Considering then the total availability of substitute teachers, school districts across the United States have been experiencing a shortage of substitute teachers since as early as 1999 (Candisky, 1999; Mueller, 1999; Sahagun, 1999). The reasons to pursue employment as a substitute teacher are diverse and even once one is added to an available substitute pool, a large percentage of substitute teachers move on to other jobs requiring administrators to engage in constant replenishment efforts (Wyld, 1995). Strategies to address increasing the substitute teacher pool size have included increasing pay, offering benefits or bonuses, and hiring "permanent" substitutes despite little peer reviewed analysis of their efficacies (Rogers, 2001).

We now examine the decision-making process of substitute teachers once they have entered an available substitute pool. Knowing the preferences of substitute teachers is important if one is to attempt to satisfy the demand caused by teacher absences and the impact unfilled absences have on a local school (Gershenson, 2012). Importantly, preferences must be examined in the context of two central questions: How are opportunities to obtain assignments communicated to substitute teachers, and is the decision to select or not select one of consequence to the substitute teacher (Coverdill \& Oulevey, 2007).

Some determinants of this decision-making process include the amount of time between notification of an opportunity and it actual date (lead time), the time to commute to the location, day of the week, classroom type, the type of school, and school quality (Gershenson, 2012). Where automated substitute teacher management systems are used, Coverdill finds three emergent patterns:
(1) substitutes shape the timing and content of assignments through strategic use of relationships with teachers and the automated system;
(2) the automated system curbs ascription by providing assignments independent of relationships; and
(3) substitutes view assignments secured through relationships as better and more satisfying (Coverdill \& Oulevey, 2007).

We believe it important to consider organizational and local school support of substitute teaches in this analysis as "[t]he responsibility for improving substitute teaching should be shared between the teachertraining institution and the school system" (Parson \& Dillon, 1980-81). Literature suggests that outcomes and job satisfaction of substitute teachers can be improved with training (Peterson, 1991). Additionally, standardization in the form of resources offered to each substitute from each school is helpful, including school specific information from the office and classroom specific items from the teacher (Augustin, 1987).

## Methods

## Data

Data was gathered from the following District organizational assets.

- Human Resources/Payroll System (Peoplesoft)
- Substitute Employee Management System (AESOP)
- Data Warehouse (DW)

## Sample

Peoplesoft
The sample included teacher recorded absences and substitute teacher pay in Peoplesoft. The sampling includes fiscal year 2015 through fiscal year 2017 which reflects the migration date from a legacy reporting system to the current Peoplesoft Time and Labor module. While teacher recorded absences exist in Peoplesoft prior to this date, changes in coding and in recording practice make comparisons before and after this date slightly dubious.

Include:

- Teacher union codes
- Teacher, Teacher-in-Charge, and Intern teacher job family codes
- Traditional schools and Instrumentality charters

Exclude:

- Absences recorded as "Vacation Payout"
- Summer school
- Hourly staff
- Absence records recorded as "HIST" reflecting corrected absence entries whose inclusion would otherwise overstate activity.

AESOP
The sample included absence event activity recorded in AESOP. The sampling includes fiscal year 2015 through fiscal year 2017 which reflects the begin date of that system.

Include:

- Teacher worker types
- Traditional schools and Instrumentality charters

## Data Warehouse

The sample included school location information recorded the Data Warehouse.
Include:

- District reporting locations

Exclude:

- Non-instrumentality and partnership schools

## Measures

## Teacher Absence Rate

Teacher absences are recorded as absence transactions in Peoplesoft. The teacher absence rate is the total hours recorded as absent divided by the total hours scheduled to work based on the effective entry date of the job and the position's pay calendar.

## Teacher Absence Fill Rates

Absence events are recorded in AESOP and can be coded as one of two types: (1) Fill Needed, or (2) Fill Not Needed. The absence event can then be coded as having been: (1) Filled, or (2) Not filled. The teacher absence fill rate is the total teacher absence events that are coded Filled Needed and Filled divided by the total teacher absence events that are coded Fill Needed.

## AESOP Absence Event Lead Time

Absence events are recorded in AESOP with an entry date of the transaction into the system and can be entered in advance of the actual absence date. The number of calendar days between the entry date (also, the earliest visibility to substitute teacher for selection) and the absence date is the lead time of the absent event.

## Teacher Position Vacancy and Teacher Position Vacancy Rate

Teacher absence events are recorded in AESOP and can be coded as of type Vacancy Position. This is unique from other types in that it indicates an event for which a budgeted position has not been assigned a teacher rather than an event for which a teacher is assigned but merely absent. The corresponding rate is the percentage of all AESOP teacher absence events coded as Fill Needed and marked as Vacancy Position.

## Teacher Absence to AESOP Event Match Rate

Teacher absence records are recorded in Peoplesoft and are related to the teacher absence events recorded in AESOP. Accordingly, testing for the presence of an AESOP absence event for each recorded teacher absence in Peoplesoft can be a measure of procedural fidelity and reveal hidden control weaknesses. The match rate is simply the percentage of Peoplesoft Absence records that have a matching AESOP absence event record.

AESOP Event to Teacher Absence Match Rate
Conversely, this match rate tests the percentage of the AESOP absence event records that have a matching Peoplesoft Absence record.

## Analyses and Results

## Teacher Absence Rate

The rates at which teachers are absent has increased each fiscal year moving from 6.2\% in fiscal year 2015 to $6.7 \%$ in fiscal year 2017. Total absence hours have increased despite consistent numbers of teachers (see Table 1). All school groups saw an increase in absence rate with Middle Schools seeing the largest increase ( $6.4 \%$ to $7.5 \%$, see Table 2).

Table 1
Summary of Teacher Absences for Fiscal Years 2015-2017

| Measure | 2015 | 2016 | 2017 |
| :--- | ---: | ---: | ---: |
| Count of Teachers | 4,698 | 4,737 | 4,696 |
| Total Hours Teachers Absent | 420,954 | 435,227 | 450,930 |
| Teacher Absence Rate | $6.2 \%$ | $6.4 \%$ | $6.7 \%$ |

Table 2
Summary of Teacher Absences by Group for Fiscal Years 2015-2017

| Group | 2015 | 2016 | 2017 |
| :--- | :--- | :--- | :--- |
| Elementary School | $5.9 \%$ | $6.2 \%$ | $6.4 \%$ |
| Elementary/Secondary Combined | $6.8 \%$ | $6.3 \%$ | $7.3 \%$ |
| High School | $6.9 \%$ | $7.1 \%$ | $7.0 \%$ |
| Middle School | $6.4 \%$ | $6.6 \%$ | $7.5 \%$ |
| District Wide | $6.2 \%$ | $6.4 \%$ | $6.7 \%$ |

An increase in absence rate was observed across nearly all demographic groups from fiscal year 2015 to fiscal year 2017 (see Table 3).

Table 3

Summary of Teacher Absences by Demographic for Fiscal Years 2015-2017

| Demographic | 2015 |  | 2016 |  | 2017 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{array}{r} \text { \# of } \\ \text { Teachers } \end{array}$ | Absence Rate | \# of Teachers | Absence Rate | \# of Teachers | Absence Rate |
| White | 3262 | 6.0\% | 3289 | 6.1\% | 3243 | 6.5\% |
| African American | 812 | 7.2\% | 795 | 7.4\% | 789 | 7.6\% |
| Hispanic | 419 | 6.1\% | 433 | 6.5\% | 428 | 6.5\% |
| Asian | 99 | 6.1\% | 102 | 6.3\% | 109 | 6.0\% |
| Not Specified | 63 | 5.6\% | 67 | 5.9\% | 67 | 6.3\% |
| Native American | 25 | 5.9\% | 25 | 7.8\% | 22 | 7.6\% |
| Multiple | 16 | 4.8\% | 25 | 7.3\% | 36 | 7.1\% |
| Pacific Islander | 2 | 22.9\% | 1 | 4.6\% | 2 | 4.6\% |
| Total | 4698 | 6.2\% | 4737 | 6.4\% | 4696 | 6.7\% |

The absence rate of teachers rises with years of service before plateauing and decreasing thereafter. With few exceptions, the absence rate across all years of service was highest in fiscal year 2017 (see Figure 1).

Figure 1
Summary of Teacher Absences by Years of Service for Fiscal Years 2015-2017

## Teacher Absence Fill Rates

Teacher absence fill rates have decreased every year moving from a district-wide fill rate of $85 \%$ in fiscal year 2015 to $82 \%$ in fiscal year 2017. Elementary and Middle schools all saw decreases over this period with Middle Schools experiencing the largest decrease ( $84 \%$ to $77 \%$ ). High school and Elementary/Secondary Combined fill rates have remained relatively constant in the same period (see Table 4).

Table 4
Teacher Absence Fill Rates by Group for Fiscal Years 2015-2017

| Group | 2015 | 2016 | 2017 |
| :--- | :---: | :---: | :---: |
| Elementary School | $82 \%$ | $79 \%$ | $78 \%$ |
| Elementary/Secondary Combined | $89 \%$ | $89 \%$ | $88 \%$ |
| High School | $92 \%$ | $92 \%$ | $91 \%$ |
| Middle School | $84 \%$ | $78 \%$ | $77 \%$ |
| District Wide | $85 \%$ | $83 \%$ | $82 \%$ |

When comparing the lead time in calendar days with which an absence is known and posted in AESOP we see the fill rates near $40 \%$ when the absence is posted the same day. The fill rate approaches $90 \%$ when the lead time is 4 days and asymptotically approaches $100 \%$ thereafter (see Figure 2).

Figure 2
Comparing the Fill Rate of an Absence to its Posting Lead Time

Disaggregating the association of fill rate to lead time in calendar days by day of the week reveals fill rates that range from $30 \%$ to $54 \%$ with no lead time, depending on the day of the week. These differences in fill rates between days of the week shrink as the days of lead time increase and the fill rate of each approximates each other within 4 days of lead time (see Figure 3)

Figure 3
Comparing the Fill Rate of an Absence by Day of Week to its Posting Lead Time
Fill Rates by Day of Week Compared to Absence Lead Time Fiscal Years 2015-2017

Disaggregating the association of fill rate to lead time in calendar days by school type reveals fill rates that range from $32 \%$ to $62 \%$ with no lead time, depending on the school type. These differences in fill rates between school types shrink as the days of lead time increase and the fill rate of each approximates each other within 5 days of lead time (see Figure 4)

Figure 4
Comparing the Fill Rate of an Absence by School Type to its Posting Lead Time
Fill Rates by School Type Compared to Absence Lead Time -
Fiscal Years 2015-2017

Teacher Position Vacancy and Teacher Position Vacancy Rate
The rates at which AESOP absence events are labeled as position vacancies has increased since fiscal year 2015 with a district-wide rate of $28 \%$ in fiscal year 2015 and a rate of $39 \%$ in fiscal year 2017. All groups saw an increase with Middle Schools seeing the largest increase ( $31 \%$ to $44 \%$ ) over the same period (see Table 5).

Table 5
Teacher Position Vacancy Rates by Group for Fiscal Years 2015-2017

| Group | 2015 | 2016 | 2017 |
| :--- | :---: | :---: | :---: |
| Elementary School | $24 \%$ | $31 \%$ | $36 \%$ |
| Elementary/Secondary Combined | $20 \%$ | $38 \%$ | $37 \%$ |
| High School | $42 \%$ | $43 \%$ | $49 \%$ |
| Middle School | $31 \%$ | $41 \%$ | $44 \%$ |
| District Wide | $28 \%$ | $35 \%$ | $39 \%$ |

## Transaction Match Rates

Reconciling the transactional activity between each of the systematic parts in the process provides measures of procedural fidelity and possibly hidden control weaknesses. Not unlike the three-way match that one tests in accounts payable, (purchase order, invoice, payment), the substitute system should reconcile a teacher absence, absence event, and payment to substitute. Figure 5 presents a system diagram and paths of reconciliation.

Figure 5
Paths of System Reconciliation in the Absence Process

AESOP Event to Teacher Absence Match Rate (AESOP Match Rate)
The rates at which AESOP absence events match corresponding Peoplesoft absence records has remained above $90 \%$ since the inception of the AESOP system (see Table 6).

Table 6
AESOP Event to Teacher Absence Match Rates in fiscal years 2015-2017

| Measure | 2015 | 2016 | 2017 |
| :--- | ---: | ---: | ---: |
| Total Teacher AESOP Events | 30,001 | 37,291 | 44,983 |
| AESOP Match Rate | $92 \%$ | $96 \%$ | $94 \%$ |

Teacher Absence to AESOP Event Match Rate (Teacher Absence Match Rate)
The rates at which Peoplesoft absence records match corresponding AESOP absence events has increased every year but has not exceeded 60\% since the inception of the AESOP system (see Table 7).

Table 7
Teacher Absence to AESOP Event Match Rates in fiscal years 2015-2017

| Measure | 2015 | 2016 | 2017 |
| :--- | ---: | ---: | ---: |
| Total Teacher Absences | 79,078 | 83,885 | 86,323 |
| Teacher Absence Match $56 \%$ $58 \%$ $60 \%$ <br> Rate     <br> Ren  |  |  |  |

## Discussion

There are key findings:

- The strength of the association between absence lead time and fill rates needs to be further explored. Disaggregation by school level, individual school, fiscal year, etc. will reveal if this factor by itself explains most of the fill rate variation seen across the district. With four calendar days of lead time, fill rates exceed $90 \%$ district-wide in aggregation.
- $40 \%$ of the teacher absences recorded in Peoplesoft do not have a corresponding transaction in AESOP. This low match rate should be investigated further to determine if procedures are not being followed, controls should be added, or if a separate unknown process is occurring.

The analysis contains the following limitations:

- All absence types were included. While this allows for disaggregation later, the inclusion of absences for professional development and other district mandated events, to the extent they exist, is reflected in the teacher absence rate.

10 month teachers can accrue up to a maximum of 100 hours of sick leave per year and 1100 hours over their career. Prior to July 1, 2013, these accruals were accompanied with the incentive of a subsidized retiree health benefit, if 990 hours were banked at the time of eligible retirement. For new hires after July 1, 2013, this incentive no longer exists and these sick leave accrual amounts are likely anachronistic and due for reconsideration.

Further, teachers may take up to 32 hours of this sick leave as miscellaneous leave for any reason, with prior written approval. Considering the usage of sick leave by teachers as personal leave as suggested by the literature, an analysis should be conducted of the usage of a teacher's miscellaneous time. If any portion of sick leave used as personal leave could be converted to this miscellaneous leave, it would likely increase the lead time of the absence, allowing an exploitation of its relationship to improved fill rates.

The number of AESOP absence events coded as vacant position is approaching 40\%. It is not known if this is the result of better reporting and recording or an actual uptick in the number of vacant positions, or both. It is not known if other districts record vacant positions in their substitute management system to allow a comparison. It should be noted that this is only a proxy measure of teacher vacancies in the district.

A reconciliation of substitute teacher payments matched to AESOP recorded absence event was not included, though conducting such a reconciliation is advisable for the same reasons stated above.
